Pedigree MatchMaker/EID Race Reader -Simple Race Design-

When looking to use an EID reader for either pedigree matchmaker, or for reading tags of sheep running single file down a race, a timber race is one of the best options. The following is a simple race design that can be easily and cheaply constructed. Many hardware/timber stores will cut timber to length for you, and this design capitalises on this option.

Materials

- 3 x 150mm x 25mm at 3.6m - All cut in half
- 2 x 90mm x 35mm at 2.4m - Cut in half
- 1 x 90mm x 35mm at 2.4m - Cut into 4 (600mm each)
- 16 x 70mm Batten Screws
- 24 x 50mm Batten Screws

Assuming all timber is cut to length by the hardware store as suggested the only tool required is a cordless drill with appropriate batten screw hex bit. Total construction time is approximately 20 minutes.
